

ILGA Graph App - One-Page Summary

What It Is

ILGA Graph (branded as 'The Land of Kei') is a FastAPI web app focused on Illinois advocacy for legal kei vehicle registration, plus a GraphQL API.

Who It's For

Primary persona: Illinois constituents and campaign organizers who need to quickly identify legislators, perform outreach, and track engagement.

What It Does

- ZIP lookup finds your senator, representative, and a power-broker target.
- Guided call/email drawer provides prewritten outreach scripts and templates.
- Outreach progress tracking supports signed-in users and signed-out fallback.
- Intelligence dashboards show bill/member deep-dives, anomalies, and trends.
- Power Map page visualizes influence and co-sponsorship relationships.
- GraphQL endpoint exposes members, bills, committees, votes, slips, search.

How It Works (Repo Evidence)

- Ingestion: scrapers + ETL load ILGA data (members, bills, votes, slips).
- Startup: lifespan loads cache/scrape path, computes analytics and graph data.
- Runtime state: app_state holds members/bills/committees plus analytics.
- Serving: FastAPI routers render Jinja pages; Strawberry GraphQL at /graphql.
- Persistence: async SQLAlchemy + SQLite (data/ilga.db), Alembic migrations.
- Outputs: optional ML artifacts in processed/ and Obsidian vault export.

How To Run (Minimal)

1. Install deps: make install
2. Start app: make dev
3. Open: http://127.0.0.1:8000
4. Optional fresh legislative data: make scrape

Not found in repo: a single canonical production hosting topology diagram.
